Our company profile

SIRE was established in 1987. We have an extensive experience in cooling water systems to all types of industries.

Our portfolio includes air-cooled and water-cooled chillers, heat-pumps and chillers with heat-recovery, containerized chiller units for concrete cooling, with capacities ranging from 6kW to 1.5MW+, shell and tube heat exchangers and cooling towers.

In addition to these models, we are prepared to respond to the market with special chiller models for saltwater or naval chillers with titanium condensers and evaporators. We also offer chillers with heat pumps for climatization.

All equipment is built with anticorrosion materials, enabling the placement of the equipment outdoor, and has a strict quality control, planning, production and finishes, which gives the client a product of guaranteed, excellent quality and reliability.

SIRE produces special models for any capacity or schematics; if the models on our catalogue do not fit your project specifications, please contact us for a solution tailored just for your needs.

SIRE's chillers are designed and manufactured according to carefully defined and strict norms and quality standards.

We build highly efficient chillers and constructed with excellent materials that guarantee that our client gets the equipment with the maximum capacity outlined in the factory, ensuring a very high COP.

Our chillers are submitted to a demanding series of control tests in terms of quality and durability.

Building your world

With our clients and representatives, we are here now.
With you, we will go further!
